## Introduction

Antipsychotic medications are a class of drugs primarily used to treat acute psychosis (regardless of cause) and chronic psychotic disorders such as schizophrenia. They are also effective for managing acute agitation, bipolar mania, and several other psychiatric conditions. First-generation antipsychotics (FGAs), sometimes called “typical” antipsychotics, were the original drugs developed for psychosis. They are effective but are associated with a higher risk of movement-related side effects, such as extrapyramidal symptoms (EPS) and tardive dyskinesia. Second-generation antipsychotics, also known as “atypical” antipsychotics, generally have a lower risk of EPS and tardive dyskinesia compared to FGAs. This policy describes when second-generation antipsychotics may be considered medically necessary.

**Note:** The Introduction section is for your general knowledge and is not to be taken as policy coverage criteria. The rest of the policy uses specific words and concepts familiar to medical professionals. It is intended for providers. A provider can be a person, such as a doctor, nurse, psychologist, or dentist. A provider also can be a place where medical care is given, like a hospital, clinic, or lab. This policy informs them about when a service may be covered.

## Policy Coverage Criteria

This policy contains separate criteria to be used based on the member's formulary. Please check the member Plan booklet or member ID card for coverage and click the links below to navigate to the appropriate section:

**Section 1: Open, Preferred, and Select Formulary Plans (Rx Plan A1, A2, B3, B4, C4, and F1)**

**Section 2: Essentials Formulary Plans (Rx Plan E1, E3, E4) and Plans with the High Cost Low Value Drug List**

**Section 3: Individual/Small Group/Student ISHIP Metallic Formulary Plans (Rx Plan M1, M2, and M4)**

The following section applies to Open, Preferred, and Select formulary plans (Rx Plan A1, A2, B3, B4, C4, and F1). Please refer to the member plan booklet or member ID card.

Section 1: Open, Preferred, and Select Formulary Plans (Rx Plan A1, A2, B3, B4, C4, and F1)	
Drug	Medical Necessity
<ul style="list-style-type: none"> <li>Abilify (aripiprazole)</li> <li>Brand quetiapine</li> <li>Caplyta (lumateperone)</li> <li>Clozaril (clozapine)</li> <li>Fanapt (iloperidone)</li> <li>Geodon (ziprasidone) oral</li> <li>Invega (paliperidone)</li> <li>Latuda (lurasidone)</li> <li>Lybalvi (olanzapine and samidorphan)</li> <li>Risperdal (risperidone)</li> <li>Saphris (asenapine)</li> <li>Secuado (asenapine transdermal)</li> <li>Seroquel (quetiapine)</li> <li>Seroquel XR (quetiapine extended release)</li> <li>Versacloz (clozapine)</li> <li>Vraylar (cariprazine)</li> <li>Zyprexa (olanzapine)</li> </ul>	<p><b>Brand second-generation antipsychotics may be considered medically necessary when:</b></p> <ul style="list-style-type: none"> <li>The individual has tried 1 generic second-generation antipsychotic (e.g., aripiprazole, olanzapine, paliperidone, quetiapine, risperidone, ziprasidone) and had an inadequate response or intolerance<sup>1</sup></li> </ul> <p><sup>1</sup><b>Note:</b> Only applies to individuals not previously treated with requested therapy</p>

Drug	Investigational
As listed	<p>Use of the drugs for conditions not listed in this policy are considered investigational.</p> <p>The medications listed in this policy are subject to the product's US Food and Drug Administration (FDA) dosage and administration prescribing information unless noted otherwise for the medication under the medical necessity criteria.</p>

Length of Approval	
Approval	Criteria
Initial authorization	Non-formulary exception reviews and all other reviews for all drugs listed in policy may be approved up to 12 months.
Re-authorization criteria	Non-formulary exception reviews and all other reviews for all drugs listed in policy may be approved up to 12 months as long as the drug-specific coverage criteria are met, and chart notes demonstrate that the individual continues to show a positive clinical response to therapy.

Documentation Requirements
<p>The individual's medical records submitted for review for all conditions should document that medical necessity criteria are met. The record should include the following:</p> <ul style="list-style-type: none"> <li>Office visit notes that contain the diagnosis, relevant history, physical evaluation and medication history</li> </ul>

## Coding

## Related Information

## Consideration of Age

Age limits specified in this policy are determined according to FDA-approved indications, where applicable.

## Benefit Application

The drugs in this policy are oral medications and managed through the pharmacy benefit.

## Evidence Review

---

### Summary of Evidence

#### Cobenfy (xanomeline and trospium chloride)

Cobenfy (xanomeline and trospium chloride) is an oral first-in-class muscarinic agonist for the treatment of schizophrenia in adults. It combines xanomeline, an M1/M4 muscarinic receptor agonist, with trospium chloride, a muscarinic receptor antagonist that offsets the peripheral effects of xanomeline and does not appreciably cross the blood-brain barrier. Approval was based on data from the EMERGENT clinical program, which includes three placebo-controlled studies and two open-label trials assessing long-term safety and tolerability of Cobenfy for up to 1 year. The Phase 3 EMERGENT-2 and EMERGENT-3 trials demonstrated that Cobenfy significantly reduced schizophrenia symptoms compared to the placebo. Unlike first- and second-generation antipsychotics (SGAs), which are associated with adverse events including extrapyramidal symptoms, weight gain, QTc prolongation, and an increased risk for diabetes, the Cobenfy Phase 3 studies consistently found no significant changes in weight, lipid levels, glucose, insulin, or alertness. The most common adverse reactions with Cobenfy therapy ( $\geq 5\%$  and at least twice the rate of placebo) were nausea, dyspepsia, constipation, vomiting, hypertension, abdominal pain, diarrhea, tachycardia, dizziness, and gastroesophageal reflux disease. Cobenfy's label does not carry antipsychotic class warnings or precautions, and it does not include a Boxed Warning. However, it is contraindicated in individuals with urinary retention, moderate or severe kidney or liver disease, gastric retention, untreated narrow-angle glaucoma, or a history of hypersensitivity to Cobenfy or its components.

## Bipolar Depression

The other established medications for the treatment of bipolar depression are more problematic for the following reasons:

- Symbyax: The fixed dose combination makes dose adjustments difficult, and olanzapine metabolic side-effects are considerably more problematic than Latuda or Seroquel XR.
- Lithium: Multiple daily dosing needed, plus small window between therapeutic and toxic serum levels, plus more problematic side-effects, plus augmentation with an SGA antipsychotic is not infrequently needed.
- Lamotrigine: Multiple daily dosing needed, plus risk of SJ syndrome (and have to d/c with any rash, even if eventually not SJ syndrome), plus sub-optimal efficacy for acute depressive symptoms.
- Immediate-release quetiapine: Multiple daily dosing needed, plus more sedating than Latuda, plus XR formulation has a “smoother” clinical effect.

## Parkinson's Disease Psychosis

Psychotic symptoms in Parkinson's disease (PD) are relatively common and, in addition to creating a disturbance in individuals' daily lives, have consistently been shown to be associated with poor outcome. Our understanding of the pathophysiology of psychosis in PD has expanded dramatically over the past 15 years, from an initial interpretation of symptoms as dopaminergic drug adverse effects to the current view of a complex interplay of extrinsic and disease-related factors. PD psychosis has unique clinical features, namely that it arises within a context of a clear sensorium and retained insight, there is relative prominence of visual hallucinations and progression occurs over time. PD psychosis tends to emerge later in the disease course, and disease duration represents one risk factor for its development. The use of anti-PD medications (particularly dopamine receptor agonists) has been the most widely identified risk factor for PD psychosis. Other risk factors discussed in the literature include older age, disease severity, sleep disturbance, cognitive impairment, dementia and/or depression.

Traditionally, treatment begins with a search for correctable infectious, toxic, and metabolic etiologies. If symptoms persist, anti-Parkinson's disease medications are slowly reduced. However, withdrawal of these drugs usually worsens parkinsonism and is often not tolerated. Certain atypical antipsychotics can be used to treat psychosis without compromising motor

function. The choice of atypical antipsychotics is largely based on ease of use and adverse effect profile as most have comparable efficacy in improving psychosis.

At the time of this update, Nuplazid is the first FDA-approved treatment for hallucinations and delusions associated with Parkinson's disease psychosis.

## History

Date	Comments
01/01/26	New policy, approved December 9, 2025. Add to Prescription Drug section. Moved coverage criteria for all Antipsychotics (Second Generation, "Atypicals"), Brands from policy 5.01.605 to policy 5.01.659 Antipsychotics. New policy sections for Metallic (individual/small group/student ISHIP) formulary plans, Essentials formulary plans, and Open/Preferred/Select formulary plans and plans with no pharmacy benefit coverage. Added different coverage criteria for Metallic (individual/small group/student ISHIP) formulary and Essentials formulary plans for Second Generation Antipsychotics. Removed brand clozapine and brand clozapine ODT as drugs are no longer on the market. Removed Mezofy (aripiprazole) as drug has been discontinued.

**Disclaimer:** This medical policy is a guide in evaluating the medical necessity of a particular service or treatment. The Company adopts policies after careful review of published peer-reviewed scientific literature, national guidelines and local standards of practice. Since medical technology is constantly changing, the Company reserves the right to review and update policies as appropriate. Member contracts differ in their benefits. Always consult the member benefit booklet or contact a member service representative to determine coverage for a specific medical service or supply. CPT codes, descriptions and materials are copyrighted by the American Medical Association (AMA). ©2026 Premera All Rights Reserved.

**Scope:** Medical policies are systematically developed guidelines that serve as a resource for Company staff when determining coverage for specific medical procedures, drugs or devices. Coverage for medical services is subject to the limits and conditions of the member benefit plan. Members and their providers should consult the member benefit booklet or contact a customer service representative to determine whether there are any benefit limitations applicable to this service or supply. This medical policy does not apply to Medicare Advantage.
