Introduction

The panniculus (or pannus) is an extremely large fold of excess skin, fat, and tissue that hangs well below the waist and even down to the groin. It’s found in people who are very overweight. It may also be found in those who have lost a lot of weight, and following the weight loss their extra skin hangs far below the belly area. A panniculectomy is surgery to remove this excess tissue. A panniculectomy may be cosmetic (to improve looks only). The plan does not cover cosmetic surgeries. There are some instances, however, where the panniculus is causing medical problems that interfere with a person’s everyday functioning. This policy describes when surgery to remove the panniculus may be considered medically necessary. This policy also discusses abdominoplasty, which is a cosmetic surgery that is usually done in people who have a big belly. In an abdominoplasty, the surgeon removes excess skin and fat from the middle and lower abdomen and tightens the belly muscles. An abdominoplasty is also called a “tummy tuck” and is always considered to be cosmetic.

Note: The Introduction section is for your general knowledge and is not to be taken as policy coverage criteria. The rest of the policy uses specific words and concepts familiar to medical professionals. It is intended for providers. A provider can be a person, such as a doctor, nurse, psychologist, or dentist. A provider also can be a place where medical care is given, like a hospital, clinic, or lab. This policy informs them about when a service may be covered.

Policy Coverage Criteria
### Service | Medical Necessity
--- | ---
Panniculectomy | **Panniculectomy surgery may be considered medically necessary when ALL of the following criteria are met:**
- The panniculus hangs to or below the level of the symphysis pubis documented by front and lateral view photographs **AND**
- The panniculus causes a functional impairment (see definition below) such as a chronic and persistent skin condition (eg, intertriginous dermatitis, panniculitis, cellulitis, or skin ulcerations) that has failed to respond to at least 3 months of medical treatment which may include any of the following:
  - Antifungals
  - Antibiotics
  - Corticosteroids **AND**
- The surgery is expected to restore or improve the functional impairment

**NOTE**
- In addition to the criteria listed above, if the procedure is following significant weight loss (usually ≥ 100 lbs) **and**
  - If the weight loss was unrelated to bariatric surgery, the individual has maintained a stable weight for at least 6 months **OR**
  - If the weight loss is a result of bariatric surgery, the panniculectomy is not performed until at least 12 months after the bariatric surgery and then only when the individual has maintained a stable weight for at least the most recent 6 months

**Panniculectomy surgery is considered not medically necessary when criteria are not met.**

Procedures are considered cosmetic when performed solely to improve physical appearance.
Abdominoplasty | An abdominoplasty surgery, including a mini or modified abdominoplasty, is considered cosmetic as the procedure does not address any physical functional condition.

Redundant skin removal | Procedures to remove redundant skin (skin laxity) in the arms, buttocks, hips, legs, thighs, or torso are considered cosmetic as these procedures do not address any physical functional condition. Procedures to remove redundant skin include but are not limited to the following:
- Belt Lipectomy
- Circumferential Body Lift
- Circumferential Lipectomy
- Lipoabdominoplasty
- Lower Body Lift
- Suction Lipectomy
- Torsoplasty

(See Related Policies for procedures not addressed in this policy)

Diastasis recti treatment | Treatment of diastasis recti is considered cosmetic as the separation/laxity of the muscles of the abdominal wall is not considered a true hernia and the treatment does not address a physical functional condition. (See Definition of Terms below)

**Documentation Requirements**

**Panniculectomy Surgery**

Written documentation in the medical record for panniculectomy surgery must include:
- The specific physical functional impairment that would be resolved by the panniculectomy.
- Front and lateral view photographs demonstrating redundant/excessive skin or the size of the panniculus.
- Clinical observations about the nature/extent of any chronic/persistent skin conditions present such as skin irritation or infection resulting in pain, ulceration, suprapubic intertrigo, monilial infestation or panniculitis.
- Information should include the conservative medical treatments for persistent skin irritation that were tried for at least a 3-month period. (Examples may include, but are not limited to antifungal, antibacterial or moisture-absorbing agents, topically applied skin barriers and supportive garments.)

### Related Information

#### Definition of Terms

(Terms taken in part from the American Society of Plastic Surgeons Position Papers)
**Abdominoplasty:** Also known as a tummy tuck, this surgery removes loose folds of skin on the middle and lower abdomen and tightens underlying stomach muscles. It may include a diastasis recti repair.

**Belt Lipectomy:** A surgery that removes excess skin and/or fat from the thighs, hips, buttocks and abdomen. The procedure involves removing a “belt” of tissue from around the circumference of the lower trunk.

**Circumferential Lipectomy:** A surgery that combines an abdominoplasty or panniculectomy with flank and back lifts, both procedures being performed together sequentially and including suction assisted lipectomy, where necessary.

**Cosmetic procedures/services:** In this policy, cosmetic procedures/services are those which are primarily intended to preserve or improve appearance. Cosmetic surgery is performed to reshape normal structures of the body in order to improve the patient’s appearance or self-esteem.

**Diastasis recti:** A separation between the right and left side of the rectus abdominis muscles that cover the front of the abdomen. The muscle separation appears as a ridge down the middle of the abdomen. It does not lead to complications that need any intervention and does not represent a true ventral hernia.

**Lower body lift:** Also known as a belt lipectomy (see above).

**Panniculectomy:** A surgery that involves only the removal of excess skin/fat that hangs over the genitals and/or thighs. A cosmetic abdominoplasty is sometimes performed at the same time as a functional panniculectomy.

**Panniculus:** Also called a “pannus”, a panniculus is a large fold of excess skin, fat, and tissue that hangs from the lower abdomen and may extend to and beyond the groin.

**Physical Functional Impairment:** In this policy, physical functional impairment means a limitation from normal (or baseline level) of physical functioning that may include, but is not limited to, problems with ambulation, mobilization, communication, respiration, eating, swallowing, vision, facial expression, skin integrity, distortion of nearby body parts or obstruction of an orifice. The physical functional impairment can be due to body structure, congenital deformity, pain, or other causes. Physical functional impairment excludes social, emotional and psychological impairments or potential impairments.

**Reconstructive Surgery:** In this policy, reconstructive surgery refers to surgeries performed on abnormal structures of the body, caused by congenital defects, developmental abnormalities, trauma, infection, tumors or disease. It is generally performed to improve function.
**Torsoplasty:** A series of operative procedures, usually done together to improve the contour of the torso, usually female (though not exclusively). This series would include abdominoplasty with liposuction of the hips/flanks and breast augmentation and/or breast lift/reduction. In men, this could include reduction of gynecomastia by suction assisted lipectomy/ultrasound assisted lipectomy or excision.

**Ventral Hernia:** A ventral hernia is when a weak spot in the abdominal muscles develops and allows internal organs (such as the intestines) to push through. A true hernia repair should not be confused with diastasis recti repair that is part of a standard abdominoplasty.

**Benefit Application**

Some plan benefit descriptions specifically exclude services for, or related to, removal of excess skin following weight loss, regardless of physical functional impairment.

Refer to member contract language for any direct and specific exclusions regarding the performed services.

A Preservice Review is recommended.

**Evidence Review**

**Description**

In a severely obese patient, excess adipose tissue and skin hanging downward from the navel past the pelvis is referred to as a panniculus or pannus. It is sometimes referred to as an “apron” of extra skin and fat. The panniculus can be the result of extreme weight loss (usually 100 pounds or more) through diet and exercise or following gastric restrictive surgery for obesity.

The panniculus can cause difficulty fitting into clothing, interference with personal hygiene, impaired ambulation and be associated with lower back pain or pain in the panniculus itself. The redundant skin folds are susceptible to infections of the skin (fungal dermatitis, folliculitis, subcutaneous abscesses, ulcerations) or panniculitis. A large panniculus can complicate surgery on a morbidly obese patient.
Panniculectomy surgery may be indicated to reduce the panniculus. The surgery removes the excess skin and fat that hangs over the abdominal area. It may be indicated if the panniculus interferes with a person’s daily activities (ADLs) and/or results in severe skin conditions that do not resolve after medical treatment. A panniculectomy does not tighten the abdominal muscles. Obese patients with a very large panniculus and those who have had a massive weight loss may require more extensive and time-consuming procedures due to the severity of their defects.

A true ventral hernia that is large, symptomatic and not manually reducible may require surgery at the same time that a medically necessary panniculectomy is performed.

Surgery to reduce the amount of excess abdominal skin is often done solely for improving a person’s appearance and without any evidence of physical functional/ADL impairment. Abdominal skin redundancy may occur after pregnancy. An abdominoplasty, sometimes referred to as a “tummy tuck” is the most common cosmetic surgery performed to remove abdominal skin, fat and tighten flaccid muscles of the abdominal wall.

**Summary of Evidence**

Shermak believed that patients who have massive weight loss after open gastric bypass surgery are prone to incisional hernias. The author retrospectively studied this patient population at the Johns Hopkins Medical Institution. From February 2001 to December 2003, 40 patients had hernia repairs in combination with abdominoplasty. (Average age was 42 while the average weight loss was 152 pounds.) The average body mass index (BMI) at the time of plastic surgery was 35.6. Average abdominal skin resection was 9.9 pounds. One patient with a BMI of 41.3 had a recurrent hernia after heavy lifting within 1 year of the initial hernia repair surgery. Other complications included wound-healing problems (20%), seroma (12.5%), bleeding requiring surgical take-back (2.5%), suture abscess requiring surgical removal of suture (7.5%), bleeding anastomotic ulcer requiring transfusion (2.5%), and fatal pulmonary embolus (2.5%). Of the study group, 60% had uncomplicated healing. Shermak concluded that hernias are safely and preferentially repaired at the time of panniculectomy following gastric bypass surgery.

Body contouring after bariatric surgery is currently the fastest growing field within plastic surgery. Although bariatric procedures may produce impressive weight loss, people who achieve massive weight loss are often unhappy with the hanging folds of skin and subcutaneous tissue that remain. After massive weight loss, patients are left “deflated”. Patients go to plastic surgeons to address the deformities resulting from the massive weight loss.
