Introduction

Problems with the nose or sinuses are one of the most common reasons people go to the doctor. The usual complaint is that it’s difficult to breathe through the nose. The problems may be caused by sicknesses such as sinus inflammation or allergies, deformities, or diseases or conditions that cause growths inside the nose. Surgery to reshape the nose (rhinoplasty) may be necessary when there is extensive disease that restricts airflow. This policy identifies the criteria needed for a rhinoplasty to be covered as medically necessary. (Surgery to reshape the nose for appearance only is cosmetic and not covered.)

Note: The Introduction section is for your general knowledge and is not to be taken as policy coverage criteria. The rest of the policy uses specific words and concepts familiar to medical professionals. It is intended for providers. A provider can be a person, such as a doctor, nurse, psychologist, or dentist. A provider also can be a place where medical care is given, like a hospital, clinic, or lab. This policy informs them about when a service may be covered.

Policy Coverage Criteria

We will review for medical necessity this elective surgical procedure.

We also will review the site of service for medical necessity. Site of service is defined as the location where the surgical procedure is performed, such as an off campus-outpatient hospital.
or medical center, an on campus-outpatient hospital or medical center, an ambulatory surgical center, or an inpatient hospital or medical center.

<td>• Clinical findings of collapsed internal nasal valve at rest or collapsed external nasal valve (lateral walls) with inspiration (nasal vestibular stenosis)</td>
</tr>
<tr>
<td></td>
<td><strong>OR</strong></td>
</tr>
</tbody>
</table>
Procedure Medical Necessity

- To correct a nasal deformity secondary to trauma that is causing a significant functional impairment (eg, nasal bone fracture causing nasal airway obstruction)

AND

- Patient has symptoms of nasal obstruction (difficulty breathing or chronic rhinosinusitis [inflammation/swelling of the nasal passages and/or sinus cavities]) affecting quality of life

AND

- Infection, allergy, rhinitis, and polyps have been ruled out as the primary cause of nasal obstruction as evidenced by:
  - Obstructive symptoms persist despite conservative management for 8 weeks or greater with one of the following:
    - Decongestants or antihistamines
    - Nasal lavage
    - Oral or intranasal steroids
    - A course of antibiotics for rhinosinusitis
    - Allergy assessment and treatment

Rhinoplasty – Prevention

Rhinoplasty may be considered medically necessary to prevent development of nasal obstruction after removal of large cutaneous defect (eg, cutaneous malignancy).

Rhinoplasty – Cosmetic

Rhinoplasty for the sole purpose of changing the appearance of the nose is considered cosmetic.

Documentation Requirements

The patient’s medical records submitted for review for all conditions should document that medical necessity criteria are met.

For rhinoplasty for deformity, the records should include:
- Clinical documentation of the presence of nasal deformity secondary to cleft lip, or cleft palate, or other congenital craniofacial deformity

For rhinoplasty for obstruction, the records should include:
- Clinical findings confirming collapsed internal nasal valve at rest or collapsed external nasal valve (lateral walls) when breathing in (nasal vestibular stenosis)

OR
Documentation Requirements

• Nasal deformity secondary to trauma that is causing a significant functional impairment (eg, nasal bone fracture causing nasal airway obstruction)

AND

• Patient’s difficulty breathing through the nose is causing symptoms severe enough to affect patient’s quality of life. For example, it is causing chronic rhinosinusitis (inflammation/swelling of the nasal passages and/or sinus cavities)

AND

• Infection, allergy, rhinitis, and polyps have been ruled out as the primary cause of nasal obstruction as evidenced by:
  o Symptoms persist despite conservative management for 8 weeks or greater with one of the following:
    ▪ Decongestants or antihistamines
    ▪ Nasal lavage
    ▪ Oral steroids or intranasal steroids
    ▪ A course of antibiotics for rhinosinusitis
    ▪ Allergy assessment and treatment

Note: CPT codes, descriptions and materials are copyrighted by the American Medical Association (AMA). HCPCS codes, descriptions and materials are copyrighted by Centers for Medicare Services (CMS).
Definition of Terms

Acquired nasal abnormalities: Acquired abnormalities include enlarged adenoids, foreign bodies, disorders of the nasal septum, and abnormalities of the nasal valve, tumors, and nasal polyps.

American Society of Anesthesiologists (ASA) Score:

ASA 1 A normal healthy patient.
ASA 2 A patient with mild systemic disease.
ASA 3 A patient with severe systemic disease.
ASA 4 A patient with severe systemic disease that is a constant threat to life.
ASA 5 A moribund patient who is not expected to survive

Congenital nasal abnormalities: Congenital abnormalities that cause nasal obstruction, such as congenital pyriform aperture stenosis, choanal atresia, and deviation of the septum that may present emergently after birth.

Cosmetic: In this policy, cosmetic services are those which are primarily intended to preserve or improve appearance. Cosmetic surgery is performed to reshape normal structures of the body in order to improve the patient’s appearance or self-esteem.

Nasal obstruction: Breathing symptom often described as a sensation of insufficient airflow through the nose.

New York Heart Association (NYHA) Classification:

Class I No symptoms and no limitation in ordinary physical activity, eg, shortness of breath when walking, climbing stairs etc.
Class II Mild symptoms (mild shortness of breath and/or angina) and slight limitation during ordinary activity.
Class III Marked limitation in activity due to symptoms, even during less-than-ordinary activity, eg, walking short distances (20–100 m). Comfortable only at rest.
Class IV Severe limitations. Experiences symptoms even while at rest. Mostly bedbound patients

Physical functional impairment: In this policy, physical functional impairment means a limitation from normal (or baseline) level of physical functioning that may include, but is not
limited to, problems with ambulation, mobilization, communication, respiration, eating, swallowing, vision, facial expression, skin integrity, distortion of nearby body part(s) or obstruction of an orifice. The physical functional impairment can be due to structure, congenital deformity, pain, or other causes. Physical functional impairment excludes social, emotional and psychological impairments or potential impairments.

**Reconstructive surgery:** In this policy, reconstructive surgery refers to surgeries performed on abnormal structures of the body caused by congenital defects, developmental abnormalities, trauma, infection, tumors or disease. It is generally performed to improve function.

**Rhinoplasty:** A surgical procedure that is performed to change the shape and/or size of the nose or to correct a broad range of nasal defects. Cosmetic rhinoplasty can transform normal nasal structures to a more satisfactory appearance. Reconstructive rhinoplasty transforms nasal abnormalities or damaged nasal structures to a more normal state.

---

**Evidence Review**

**Description**

Nasal and sinus complaints are among the most common reasons for visits to primary care clinicians, otolaryngologists, and allergists. Although some clinicians consider nasal obstruction to imply a blockage within the nasal cavity, nasal obstruction is most commonly defined as a patient symptom manifested as a sensation of insufficient airflow through the nose. Nasal obstruction may be the cardinal presenting symptom of many common disease processes, such as rhinitis, sinusitis, septal deviation, adenoid hypertrophy, and nasal trauma.

Underlying causes of nasal obstruction include both mucosal disorders (medication-induced, infectious, and inflammatory conditions) and structural abnormalities (congenital deformities, acquired disease, trauma, tumors).

The surgical repair of nasal trauma and congenital defects often involves complex, staged procedures. Because of the disordered growth potential of nasal birth defects and childhood trauma, secondary surgery may be required after the child reaches adulthood to compensate for growth of the surrounding normal tissues. Deformities may be associated with other skeletal alterations which contribute to facial asymmetry. Graft and/or flaps are often used to correct deficiencies.
Summary of Evidence

Nasal fracture is the most common bone injury of the adult face and frequently results from motor vehicle accidents, sports-related injuries, and altercations. Although often initially considered minor, nasal fracture may eventually result in significant cosmetic or functional defects. Optimal management of nasal trauma in the acute setting is critical in minimizing secondary nasal deformities. In recent years, numerous guidelines have been described to refine and optimize acute nasal trauma management. However, restoration of pretraumatic form and function remains a challenge. Commonly, the product of a poorly addressed underlying structural injury, posttraumatic nasal deformity requiring subsequent rhinoplasty or seatorhinoplasty remains in as many as 50 percent of cases.

Moore and Eccles (2011) performed a systematic review to identify if there are functional benefits of septal surgery and evidence of a change in patency of the nasal airway as assessed by objective methods such as rhinomanometry, acoustic rhinometry and peak nasal inspiratory flow. They reviewed seven studies involving rhinomanometry, six studies with acoustic rhinometry and one study using nasal peak inspiratory flow. All of the studies reported an objective improvement in nasal patency after septal surgery.
